

MySQL Installation Guide

This guide explains how to install MySQL on **Windows** or **macOS** before the first session. Please complete the steps **before coming to class** so we can focus on queries and practice instead of setup issues.

What You Will Install

You will install:

- **MySQL Server** (the database engine)
- **MySQL Workbench** (a visual tool to write and run SQL queries)

Both are free.

For Windows Users

1. Open a browser and go to the official MySQL website:
<https://dev.mysql.com/downloads/installer/>
2. Download **MySQL Installer for Windows**.
Choose the **full installer** if available. This avoids missing components.
3. Run the installer.
If Windows asks for permission, choose **Yes**.
4. When asked to select a setup type, choose:
Developer Default
This installs MySQL Server, Workbench, and required tools.
5. During configuration:
 - Use the default port (**3306**)
 - Choose **Strong Password Encryption**
 - Set a **root password**
Please write this password down. You will need it later.
6. Continue clicking **Next** and **Execute** until installation finishes.
7. Open **MySQL Workbench**.
 - You should see a connection called **Local instance MySQL**
 - Click it and enter the root password you created

If MySQL Workbench opens and connects successfully, you are done.

For macOS Users

1. Open a browser and go to:
<https://dev.mysql.com/downloads/mysql/>
2. Select **Operating System: macOS**.
3. Download the **DMG Archive** (the file ends with .dmg).
4. Open the downloaded file and follow the installer steps.
5. During installation:
 - Keep the default port (**3306**)
 - Set a **root password**
Save this password somewhere safe.
6. After installation:
 - Open **System Settings** (or System Preferences)
 - Look for **MySQL**
 - Make sure the MySQL Server status is **Running**
7. Open **MySQL Workbench**.
 - Click **Local instance MySQL**
 - Enter the root password

If the connection opens without errors, the installation is complete.

Quick Test (macOS or Win)

To make sure everything works:

1. Open **MySQL Workbench**
2. Connect to **Local instance MySQL**
3. Click the **SQL Editor**
4. Run this command:

```
SELECT VERSION();
```

If you see a version number, your setup is working correctly.

Common Issues and Tips

- Forgetting the root password is the most common problem. Please save it.
- If MySQL Server is not running on macOS, start it from System Settings.
- Do not uninstall and reinstall unless instructed. Ask for help first.

- Bring your laptop to the first lab even if you are unsure about your setup.

Before Class Checklist

- MySQL Server installed
- MySQL Workbench installed
- Able to connect to Local instance MySQL
- Root password saved
